

Hymans Robertson LLP has carried out an actuarial valuation of the Isle of Wight Council Pension Fund ("the Fund") as at 31 March 2013, details of which are set out in the report dated 26 March 2014 ("the Report"), addressed to Isle of Wight Council ("the Client"). The Report was prepared for the sole use and benefit of our Client and not for any other party; and Hymans Robertson LLP makes no representation or warranties to any third party as to the accuracy or completeness of the Report.

The Report was not prepared for any third party and it will not address the particular interests or concerns of any such third party. The Report is intended to advise our Client on the past service funding position of the Fund at 31 March 2013 and employer contribution rates from 1 April 2014, and should not be considered a substitute for specific advice in relation to other individual circumstances.

As this Report has not been prepared for a third party, no reliance by any party will be placed on the Report. It follows that there is no duty or liability by Hymans Robertson LLP (or its members, partners, officers, employees and agents) to any party other than the named Client. Hymans Robertson LLP therefore disclaims all liability and responsibility arising from any reliance on or use of the Report by any person having access to the Report or by anyone who may be informed of the contents of the Report.

Hymans Robertson LLP is the owner of all intellectual property rights in the Report and the Report is protected by copyright laws and treaties around the world. All rights are reserved.

The Report must not be used for any commercial purposes unless Hymans Robertson LLP agrees in advance.

**PAGE** 

# 1 Executive summary

We have carried out an actuarial valuation of the Isle of Wight Council Pension Fund ('the Fund') as at 31 March 2013. The results are presented in this report and are briefly summarised below.

#### **Funding position**

The table below summarises the financial position of the Fund at 31 March 2013 in respect of benefits earned by members up to this date.

|                          | 31 March 2010 | 31 March 2013 |
|--------------------------|---------------|---------------|
| Past Service Position    | (£m)          | (£m)          |
| Past Service Liabilities | 393           | 499           |
| Market Value of Assets   | 296           | 388           |
| Surplus / (Deficit)      | (97)          | (111)         |
|                          |               |               |
| Funding Level            | 75%           | 78%           |

The increase in deficit reflects the adverse conditions which the Fund has had to contend with since the previous valuation. Despite a strong investment performance achieved by the Fund, which has increased the value of assets, this was offset by the decrease in the real gilt yield which increased the value placed on the Fund's liabilities.

#### **Contribution rates**

The table below summarises the average employer contribution rate that would be required, based on this triennial valuation.

|   | 31 March 2010 | 31 March 2013 |
|---|---------------|---------------|
| Contribution Rates                                | (% of pay)    | (% of pay)    |
| Employer future service rate (incl. expenses)     | 17.7%         | 20.8%         |
| Past Service Adjustment (20 year spread)          | 8.9%          | 10.6%         |
| Total employer contribution rate (incl. expenses) | 26.6%         | 31.4%         |
| Employee contribution rate                        | 6.4%          | 6.0%          |
| Expenses  | 0.6%          | 0.7%          |

The increase in the total employer contribution rate is primarily due to the decrease in the real gilt yields which has increased both the employer future service rate and the past service adjustment.

The total employer contribution (Common) rate is a theoretical figure – an average across the whole Fund. In practice, each employer that participates in the Fund has its own underlying funding position and circumstances, giving rise to its own contribution rate requirement. The minimum contributions to be paid by each employer from 1 April 2014 to 31 March 2017 are shown in the Rates and Adjustment Certificate in **Appendix G**.

## 2 Introduction

#### **Purpose**

The main purposes of this valuation are:

- to assess the extent to which the Administering Authority's funding objectives were met at 31 March 2013;
- to identify the future contributions payable by the employers that participate in the Fund in order to meet the Administering Authority's funding objectives;
- to enable completion of all relevant certificates and statements in connection with all relevant regulations;
- to comment on the main risks to the Fund that may result in future volatility in the funding position or to employers' contributions.

#### **Component reports**

This document is an "aggregate" report, i.e. it is the culmination of various "component" reports and discussions, in particular:

- The data report (dated 8 November 2013);
- The Discussion Document (dated 8 November 2013) which outlined the preliminary assumption proposals and whole Fund results;
- The formal agreement by the Administering Authority of the actuarial assumptions used in this document, at a conference call meeting dated 9 September 2013;
- The stabilisation modelling carried out for the whole Fund, as detailed in our report and presentation to the Administering Authority of 9 September 2013;
- The Funding Strategy Statement, confirming the different contribution rate setting approaches for different types of employer or in different circumstances.

Note that not all of these documents may be in the public domain.

# 3 Assumptions

#### **Actuarial assumptions**

Assumptions must be made about the factors affecting the Fund's finances in the future. Broadly speaking, our assumptions fall into two categories – financial and demographic.

Demographic assumptions typically try to forecast **when** benefits will come into payment and what form these will take. For example, when members will retire (e.g. at their normal retirement age or earlier), how long they will then survive and whether a dependant's pension will be paid.

Financial assumptions typically try to anticipate the **size** of these benefits. For example, how large members' final salaries will be at retirement and how their pensions will increase over time. In addition, the financial assumptions also help us to estimate how much all these benefits will cost the Fund in today's money.

#### **Financial assumptions**

A summary of the main financial assumptions adopted for the valuation of members' benefits are shown below.

|                       | 31 Ma   | 31 March 2010 |         | ch 2013 |
|-----------------------|---------|---------------|---------|---------|
| Financial assumptions | Nominal | Real          | Nominal | Real    |
| Discount Rate         | 6.1%    | 2.8%          | 4.6%    | 2.1%    |
| Salary Increases*     | 5.3%**  | 2.0%          | 4.3%    | 1.8%    |
| Pension Increases     | 3.3%    | -             | 2.5%    | -       |

<sup>\*</sup> Plus an allowance for promotional pay increases.

#### **Discount rate**

The funding valuation is effectively a planning exercise, to assess the funds needed to meet the benefits as they fall due. In order to place a current value on the future benefit payments from the Fund, an assumption about future investment returns is required in order to "discount" future benefit payments back to the valuation date at a suitable rate.

For a funding valuation such as this, the discount rate is set by taking into account the Fund's current and expected future investment strategy and, in particular, how this strategy is expected to outperform the returns from Government bonds over the long term. The additional margin for returns in excess of that available on Government bonds is called the Asset Outperformance Assumption (AOA).

The selection of an appropriate AOA is a matter of judgement and the degree of risk inherent in the Fund's investment strategy should always be considered as fully as possible.

Although there has been a downward shift in the expected returns on risky assets since the 2010 valuation, we believe the expected returns in excess of the returns on government bonds to be broadly unchanged since 2010. Therefore, we are satisfied that an AOA of 1.6% p.a. is a prudent assumption for the purposes of this valuation. This results in a discount rate of 4.6% p.a.

#### Price inflation / pension increases

Due to further analysis of the CPI index since 2010, we expect the average long term difference between RPI and CPI to be 0.8% p.a. compared with 0.5% p.a. at the 2010 valuation.

<sup>\*\*1%</sup> p.a. for 2010/11 and 2011/12, reverting to the long term assumption shown thereafter.

At the previous valuation, the assumption for RPI was derived from market data as the difference between the yield on long-dated fixed interest and index-linked government bonds. At this valuation, we have adopted a similar approach.

#### Salary increases

The long term assumption for salary increases is RPI plus 1% p.a. This translates to CPI plus 1.8% p.a. This is a change in approach from 2010 where we assumed 1% p.a. for 2 years and RPI plus 1.5% p.a. thereafter.

We have set a lower long term rate of salary growth to reflect both short term pay constraints and the belief that general economic growth and hence pay growth may be at a lower level than historically experienced for a prolonged period of time.

Note that this assumption is made in respect of the general level of salary increases (e.g. as a result of inflation and other macroeconomic factors). We also make a separate allowance for expected pay rises granted in the future as a result of promotion. This assumption takes the form of a set of tables which model the expected promotional pay awards based on each member's age and class. Please see **Appendix E**.

#### Longevity

The main demographic assumption to which the valuation results are most sensitive is that relating to the longevity of the Fund's members. For this valuation, we have adopted assumptions which give the following sample average future life expectancies for members:

|                                   | Actives & Deferreds |        | Current Pensioners |        |
|-----------------------------------|---------------------|--------|--------------------|--------|
| Assumed life expectancy at age 65 | Male                | Female | Male               | Female |
| 2010 valuation - baseline         | 19.8                | 22.5   | 19.8               | 22.5   |
| 2010 valuation - improvements     | 24.9                | 27.7   | 22.9               | 25.7   |
| 2013 valuation - baseline         | 19.5                | 22.6   | 20.1               | 22.4   |
| 2013 valuation - improvements     | 23.8                | 26.7   | 22.4               | 24.5   |

Further details of the mortality assumptions adopted for this valuation can be found in **Appendix E**. Note that the figures for actives and deferreds assume that they are aged 45 at the valuation date.

#### **Assets**

We have taken the assets of the Fund into account at their market value as indicated in the audited accounts for the period ended 31 March 2013.

In our opinion, the basis for placing a value on members' benefits is consistent with that for valuing the assets both are related to market conditions at the valuation date.

#### **Demographic assumptions**

We are in the unique position of having a very large local authority data set from which to derive our other demographic assumptions. We have analysed the trends and patterns that are present in the membership of local authority funds and tailor our demographic assumptions to reflect LGPS experience.

Details of these assumptions are set out in Appendix E. Further commentary on these was included in the Discussion Document.

#### Further comments on the assumptions

As required for Local Government Pension Scheme valuations, our proposed approach to this valuation must include a degree of prudence. This has been achieved by explicitly allowing for a margin of prudence in the AOA.

For the avoidance of doubt, we believe that all other proposed assumptions represent the "best estimate" of future experience. This effectively means that there is a 50% chance that future experience will be better or worse than the chosen assumption.

Taken as a whole, we believe that our proposed assumptions are more prudent than the best estimate. The assessed liability value on a "neutral" best estimate (not prudent) basis would perhaps be 10%, lower than the figures shown here.

## 4 Results

The Administering Authority has prepared a Funding Strategy Statement which sets out its funding objectives for the Fund. In broad terms, the main 'past service' objective is to hold sufficient assets in the Fund to meet the assessed cost of members' past service benefits and the main 'future service' objective is to maintain a relatively stable employer contribution rate. These objectives are potentially conflicting.

#### Past service

In assessing the extent to which the past service funding objective was met at the valuation date, we have used the actuarial assumptions described in the previous section of this report and funding method described in **Appendix C**. The table below compares the value of the assets and liabilities at 31 March 2013. The 31 March 2010 results are also shown for reference.

The results are presented in the form of a "funding level", this is the ratio of the market value of assets to the assessed cost of members' past service benefits ("liabilities").

A funding level of 100% would correspond to the funding objective being met at the valuation date.

| Valuation Date           | 31 March 2010 | 31 March 2013 |
|--------------------------|---------------|---------------|
| Past Service Position    | (£m)          | (£m)          |
| Past Service Liabilities |               |               |
| Employees                | 148           | 165           |
| Deferred Pensioners      | 59            | 86            |
| Pensioners               | 186           | 247           |
| Total Liabilities        | 393           | 499           |
| Market Value of Assets   | 296           | 388           |
| Surplus / (Deficit)      | (97)          | (111)         |
|                          |               |               |
| Funding Level            | 75%           | 78%           |

The main funding objective was not met: there was a shortfall of assets to the assessed cost of members' benefits of £111m.

#### Summary of changes to the funding position

The chart overleaf illustrates the factors that caused the funding position to improve between 31 March 2010 and 31 March 2013:

Further comments on some of the items in the above chart are set out below:

- There is an interest cost of £19m. This is broadly three years of compound interest at 6.1% p.a. applied to the previous valuation deficit of £97m.
- Investment returns being higher than expected since 2010 lead to a gain of £34m. This is roughly the difference between the actual (roughly 31%) and expected three-year return (roughly 19%) applied to the whole Fund assets from the previous valuation of £296m, with a further allowance made for cashflows during the period.
- The impact of the change in demographic assumptions has been a loss of around £1m. Underlying this figure, ill health early retirements have had a positive impact but this has been offset by less withdrawals than expected.
- The change in mortality assumptions (baseline and improvements) has given rise to a gain of £3m. This is mainly due to the gains from the change in base mortality assumptions being greater than the loss relating to the change in longevity improvements.
- The change in financial conditions between the previous valuation has led to a loss of £56m. This is due to a decrease in the real discount rate between 2010 and 2013. This has been partially been offset by the increase in our assumption of the gap between RPI and CPI.
- Other experience items, such as changes in the membership data, have served to decrease the deficit at this valuation by around £8m.
- Note that the benefit changes that come into effect as at 1 April 2014 do not change the funding position as all past service benefits to 31 March 2014 are protected.

#### **Future service**

We have calculated the average long-term contribution rate that the Fund employers would need to pay to meet the estimated cost of members' benefits that will be earned after 31 March 2013 (the 'future service contribution rate'). Again, we have used the assumptions set out in the previous section of this report and the method set out in **Appendix C**. The resulting contribution rate is that which should (if the actuarial assumptions about the future are borne out in practice) ensure that the Administering Authority's main future service funding objective is met. The table below details this future service contribution rate for 31 March 2013 and shows the 31 March 2010 for comparison.

| Valuation Date                                      | 31 March 2010 | 31 March 2013 |
|---|---------------|---------------|
| Future service rate                                 | % of pay      | % of pay      |
|   |               |               |
| Employer future service rate (excl. expenses)       | 17.1%         | 20.1%         |
| Expenses  | 0.6%          | 0.7%          |
| Total employer future service rate (incl. expenses) | 17.7%         | 20.8%         |
| Employee contribution rate                          | 6.4%          | 6.0%          |

Note that the employee contribution rate includes any additional contributions being paid by employees into the Fund as at 31 March 2013. This future service contribution rate makes no allowance for the past service deficit in the Fund described above.

The average future service rate for Fund employers is 20.8% of pay. This rate is calculated as at 31 March 2013 and therefore forms part of the total contribution rate payable by employers from 1 April 2014. Note this rate makes an allowance for changes to the benefit structure that take effect from 1 April 2014. In practice, a future service rate for each employer has been calculated which is based on their particular circumstances and membership profile. The rate above is an average future service rate for the Fund as a whole.

#### Summary of changes to the future service rate

The chart below illustrates the factors that caused the future service rate to increase between 31 March 2010 and 31 March 2013.

As can be seen from this chart, the factors that have had the biggest impact on the future service rate between 2010 and 2013 are broadly similar to those discussed for the past service position, other than asset returns.

In addition to this, the impact of the LGPS 2014 scheme has resulted in a reduction in contribution rate of 2.2% of payroll.

#### **Total common contribution rate payable**

The total (or "common") contribution rate payable is the average future service rate for Fund employers plus an additional amount to recover the deficit and bring the funding level back to 100% over a period of 20 years, as set out in the Funding Strategy Statement. This additional amount is referred to as the past service adjustment.

The common contribution rate based on the funding position as at 31 March 2013 is detailed below along with the results for 31 March 2010:

| Valuation Date                           | 31 March 2010 | 31 March 2013 |
|--|---------------|---------------|
| Total contribution rate                  | % of pay      | % of pay      |
| Future service rate (incl. expenses)     | 17.7%         | 20.8%         |
| Past service adjustment (20 year spread) | 8.9%          | 10.6%         |
| Total employer contribution rate         | 26.6%         | 31.4%         |

This does not represent the rate which any one employer is actually required to pay, nor is it the average of the actual employer rates. The actual employer contributions payable from 1 April 2014 are given in **Appendix G**, and these have been devised in line with the Funding Strategy Statement: see **section 6**.

## 5 Risk Assessment

The valuation results depend critically on the actuarial assumptions that are made about the future of the Fund. If all of the assumptions made at this valuation were exactly borne out in practice then the results presented in this document would represent the true cost of the Fund as it currently stands at 31 March 2013.

However, no one can predict the future with certainty and it is unlikely that future experience will exactly match all of our assumptions. The future therefore presents a variety of risks to the Fund and these should be considered as part of the valuation process. In particular:

- The main risks to the financial health of the Fund should be identified.
- Where possible, the financial significance of these risks should be **quantified**.
- Consideration should be given as to how these risks can then be controlled or mitigated.
- These risks should then be monitored to assess whether any mitigation is actually working.

This section investigates the potential implications of the actuarial assumptions not being borne out in practice.

Set out below is a brief assessment of the main risks and their effect on the valuation results, beginning with a look at the effect of changing the main assumptions and then focusing on the two most significant risks – namely investment risk and longevity risk.

#### Sensitivity of valuation results to changes in assumptions

The table below gives an indication of the sensitivity of the valuation results to small changes in some of the main assumptions used.

|                                     |                     | Imp           | pact                           |
|-------------------------------------|---------------------|---------------|--------------------------------|
| Assumption                          | Change              | Deficit (£m)  | Future service rate (% of pay) |
| Discount rate                       | Increases by 0.5%   | Falls by £43m | Falls by 3%                    |
| Salary increases                    | Increases by 0.5%   | Rises by £12m | -                              |
| Price inflation / pension increases | Increases by 0.5%   | Rises by £34m | Rises by 2%                    |
| Life expectancy                     | Increases by 1 year | Rises by £15m | Rises by 1%                    |

This is not an exhaustive list of the assumptions used in the valuation. For example, changes to the assumed level of withdrawals and ill health retirements will also have an effect on the valuation results. However, the table contains those assumptions that typically are of most interest and have the biggest impact.

Note that the table shows the effect of changes to each assumption in isolation. In reality, it is perfectly possible for the experience of the Fund to deviate from more than one of our assumptions simultaneously and so the precise effect on the funding position is therefore more complex.

#### **Investment risk**

#### Sensitivity of valuation results to market conditions and investment performance

As the assets of the Fund are taken at their market value, volatility in investment performance can have an immediate and tangible effect on the funding level and deficit. This is particularly relevant because the Fund is invested predominantly in riskier assets such as equities and equity-type investments (e.g. property). A rise or fall in the level of equity markets has a direct impact on the financial position of the Fund, which may seem obvious.

Less obvious is the effect of anticipated investment performance on the Fund's liabilities (and future service cost). Here it is the returns available on government bonds that are of crucial importance, as the discount rate that we use to place a value on the Fund's liabilities is based on gilt yields at the valuation date plus a margin of 1.6% p.a.

The table below shows how the funding level (top), deficit (middle, in £m) and total contribution rate (bottom, as % of pay) would vary if investment conditions at 31 March 2013 had been different. The level of the FTSE 100 Price index is taken as a suitable proxy for asset performance whilst the index-linked gilt yield is taken as a yardstick for the valuation of liabilities.

| 7          |        | 76%                  | 81%   | 85%   |
|------------|--------|----------------------|-------|-------|
| ielc       | -0.10% | (117)                | (93)  | (70)  |
| Gilt Yield |        | 30.7%                | 28.5% | 26.2% |
| Ei         |        | 73%                  | 78%   | 82%   |
| þ          | -0.30% | (135)                | (111) | (87)  |
| Linked     |        | 33.6%                | 31.4% | 29.1% |
|            |        | 70%                  | 75%   | 80%   |
| Index      | -0.50% | (153)                | (129) | (106) |
| <u>=</u>   |        | 36.5%                | 34.3% | 32.1% |
|            |        | 5912                 | 6412  | 6912  |
|            |        | FTSE 100 Price Index |       | dex   |

The shaded box contains the results for this valuation. Note that this does not take account of the performance of all asset classes held by the Fund (e.g. overseas equities, property, bonds, cash etc.) but it does serve to highlight, in broad terms, the sensitivity of the valuation results to investment conditions at the valuation date.

Note that the scenarios illustrated above are by no means exhaustive. They should not be taken as the limit of how extreme future investment experience could be. The discount rate assumption adopted at this valuation is expected to be appropriate over the long term. Short term volatility of equity markets does not invalidate this assumption.

#### **Longevity risk**

The valuation results are also very sensitive to unexpected changes in future longevity. All else being equal, if longevity improves in the future at a faster pace than allowed for in the valuation assumptions, the funding level will decline and the required employer contribution rates will increase.

Recent medical advances, changes in lifestyle and a greater awareness of health-related matters have resulted in life expectancy amongst pension fund members improving in recent years at a faster pace than was originally foreseen. It is unknown whether and to what extent such improvements will continue in the future.

For the purposes of this valuation, we have selected assumptions that we believe make an appropriate allowance for future improvements in longevity, based on the actual experience of the Fund since the previous valuation.

The table below shows how the valuation results at 31 March 2013 are affected by adopting different longevity assumptions.

|                                       | Impact       |                     |
|---------------------------------------|--------------|---------------------|
| Longevity assumption                  | Deficit (£m) | Future service rate |
| 2013 valuation (with improvements)    | (111)        | 20.8%               |
| 2013 valuation (further improvements) | (133)        | 21.8%               |
| 1 year extra                          | (148)        | 22.7%               |

The shaded box contains the results for this valuation.

Full details of the longevity improvements adopted at this valuation are set out in **Appendix E**.

The "further improvements" are a more cautious set of improvements that, in the short term, assume the 'cohort effect' of strong improvements in life expectancy currently being observed amongst a generation born around the early and mid-1930s will continue to strengthen for a few more years before tailing off. This is known as "non-peaked".

The "1 year extra" figures relative to a further year of life expectancies beyond those assumed in "further improvements".

Again, the range of assumptions shown here is by no means exhaustive and should not be considered as the limits of how extreme future longevity experience could be.

#### Other risks to consider

The table below summarises the effect that changes in some of the other valuation assumptions and risk factors would have on the funding position. Note that these are probably unlikely to have a large financial impact on the Fund and therefore the analysis is qualitative rather than quantitative.

|   | Impact          |                     |
|---|-----------------|---------------------|
| Factor                                  | Funding level   | Future service rate |
| Greater level of ill health retirement  | Decreases       | Marginal            |
| Reduced level of withdrawals            | Decreases       | Marginal            |
| Rise in average age of employee members | Marginal effect | Increases           |
| Lower take up of 50:50 option           | No impact       | Increases           |

One further risk to consider is the possibility of future changes to Regulations that could materially affect the benefits that members become entitled to. It is difficult to predict the nature of any such changes but it is not inconceivable that they could affect, not just the cost of benefits earned after the change but could also have a retrospective effect on the past service position (as the move from RPI to CPI-based pension increases already has).

#### Managing the risks

Whilst there are certain things, such as the performance of investment markets or the life expectancy of members, that are not directly within the control of the pension fund, that does not mean that nothing can be done to understand them further and to mitigate their effect. Although these risks are difficult (or impossible) to eliminate, steps can be taken to manage them.

Ways in which some of these risks can be managed could be:

- Set aside a specific reserve to act as a cushion against adverse future experience (possibly by selecting
  a set of actuarial assumptions that are deliberately more prudent).
- Take steps internally to monitor the decisions taken by members and employers (e.g. relating to early / ill health retirements or salary increases) in a bid to curtail any adverse impact on the Fund.
- Pooling certain employers together at the valuation and then setting a single (pooled) contribution rate that they will all pay. This can help to stabilise contribution rates (at the expense of cross-subsidy between the employers in the pool during the period between valuations).
- Carrying out a review of the future security of the Fund's employers (i.e. assessing the strength of employer covenants).
- Carry out a bespoke analysis of the longevity of Fund members and monitor how this changes over time, so that the longevity assumptions at the valuation provide as close a fit as possible to the particular experience of the Fund.
- Undertake an asset-liability modelling exercise that investigates the effect on the Fund of possible
  investment scenarios that may arise in the future. An assessment can then be made as to whether long
  term, secure employers in the Fund can stabilise their future contribution rates (thus introducing more
  certainty into their future budgets) without jeopardising the long-term health of the Fund.
- Purchasing ill health liability insurance to mitigate the risk of an ill health retirement impacting on solvency and funding level of an individual employer where appropriate.
- Monitoring different employer characteristics in order to build up a picture of the risks posed. Examples
  include membership movements, cash flow positions and employer events such as cessations.

We would be delighted to set out in more detail the risks that affect the Fund and discuss with you possible strategies for managing them.

## 6 Related issues

The Fund's valuation operates within a broader framework, and this document should therefore be considered alongside the following:

- the Funding Strategy Statement, which in particular highlights how different types of employer in different circumstances have their contributions calculated;
- the Statement of Investment Principles (e.g. the discount rate must be consistent with the Fund's asset strategy);
- the general governance of the Fund, such as meetings of the Pensions Committee, decisions delegated to officers, the Fund's business plan, etc;
- the Fund's risk register;
- the register of Fund employers.

#### **Further recommendations**

#### **Valuation frequency**

Under the provisions of the LGPS regulations, the next formal valuation of the Fund is due to be carried out as at 31 March 2016. In light of the uncertainty of future financial conditions, we recommend that the financial position of the Fund is monitored by means of interim funding reviews in the period up to this next formal valuation. This will give early warning of changes to funding positions and possible contribution rate changes.

#### Investment strategy and risk management

We recommend that the Administering Authority continues to regularly review its investment strategy and ongoing risk management programme.

#### New employers joining the Fund

Any new employers or admission bodies joining the Fund should be referred to the Fund actuary for individual calculation as to the required level of contribution.

#### **Additional payments**

Employers may make voluntary additional contributions to recover any shortfall over a shorter period, subject to agreement with the Administering Authority and after receiving the relevant actuarial advice.

Further sums should be paid to the Fund by employers to meet the capital costs of any unreduced early retirements, reduced early retirements before age 60 and/or augmentation (i.e. additional membership or additional pension) using the methods and factors issued by me from time to time or as otherwise agreed.

In addition, payments may be required to be made to the Fund by employers to meet the capital costs of any ill-health retirements that exceed those allowed for within our assumptions.

#### **Cessations and bulk transfers**

Any Admission Body who ceases to participate in the Fund should be referred to us in accordance with Regulation 38 of the Administration Regulations.

Any bulk movement of scheme members:

- involving 10 or more scheme members being transferred from or to another LGPS fund, or
- involving 2 or more scheme members being transferred from or to a non-LGPS pension arrangement should be referred to us to consider the impact on the Fund.

## 7 Reliances and limitations

## **Scope**

This document has been requested by and is provided to Isle of Wight Council in its capacity as Administering Authority to the Isle of Wight Council Pension Fund. It has been prepared by Hymans Robertson LLP to fulfil the statutory obligations in accordance with regulation 36 of the Administration Regulations. None of the figures should be used for accounting purposes (e.g. under FRS17 or IAS19) or for any other purpose (e.g. a termination valuation under Regulation 38(1)).

This document should not be released or otherwise disclosed to any third party without our prior written consent, in which case it should be released in its entirety. Hymans Robertson LLP accepts no liability to any other party unless we have expressly accepted such liability.

The results of the valuation are dependent on the quality of the data provided to us by the Administering Authority for the specific purpose of this valuation. We have previously issued a separate report confirming that the data provided is fit for the purposes of this valuation and have commented on the quality of the data provided. The data used in our calculations is as per our report of 8 November 2013.

#### **Actuarial Standards**

The following Technical Actuarial Standards<sup>1</sup> are applicable in relation to this report and have been complied with where material:

- TAS R Reporting;
- TAS D Data;
- TAS M Modelling; and

PA pun

Pensions TAS.

Peter Summers

Fellow of the Institute and Faculty of Actuaries

26 March 2014

<sup>&</sup>lt;sup>1</sup> Technical Actuarial Standards (TASs) are issued by the Financial Reporting Council (FRC) and set standards for certain items of actuarial work, including the information and advice contained in this report.

# Appendix A: About the Pension Fund

For more details please refer to the Fund's Funding Strategy Statement.

The purpose of the Fund is to provide retirement and death benefits to its members. It is part of the Local Government Pension Scheme (LGPS) and is a multi-employer defined benefit pension scheme.

#### **Defined benefit pension scheme**

In a defined benefit scheme such as this, the nature of retirement benefits that members are entitled to is known in advance. For example, it is known that members will receive a pension on retirement that is linked to their salary and pensionable service according to a pre-determined formula.

However, the precise cost to the Fund of providing these benefits is **not** known in advance. The estimated cost of these benefits represents a liability to the Fund and assets must be set aside to meet this. The relationship between the value of the liabilities and the value of the assets must be regularly assessed and monitored to ensure that the Fund can fulfil its core objective of providing its members with the retirement benefits that they have been promised.

#### Liabilities

The Fund's liabilities are the benefits that will be paid in the future to its members (and their dependants).

The precise timing and amount of these benefit payments will depend on future experience, such as when members will retire, how long they will live for in retirement and what economic conditions will be like both before and after retirement. Because these factors are not known in advance, assumptions must be made about future experience. The valuation of these liabilities must be regularly updated to reflect the degree to which actual experience has been in line with these assumptions.

#### **Assets**

The Fund's assets arise from the contributions paid by its members and their employers and the investment returns that they generate. The way these assets are invested is of fundamental importance to the Fund. The selection, monitoring and evolution of the Fund's investment strategy are key responsibilities of the Administering Authority.

As the estimated cost of the Fund's liabilities is regularly re-assessed, this effectively means that the amount of assets required to meet them is a moving target. As a result, at any given time the Fund may be technically in surplus or in deficit.

A contribution strategy must be put in place which ensures that each of the Fund's employers pays money into the Fund at a rate which will target the cost of its share of the liabilities in respect of benefits already earned by members and those that will be earned in the future.

#### The long-term nature of the Fund

The pension fund is a long-term commitment. Even if it were to stop admitting new members today, it would still be paying out benefits to existing members and dependants for many decades to come. It is therefore essential that the various funding and investment decisions that are taken now recognise this and come together to form a coherent long-term strategy.

In order to assist with these decisions, the Regulations require the Administering Authority to obtain a formal valuation of the Fund every three years. Along with the Funding Strategy Statement, this valuation will help determine the funding objectives that will apply from 1 April 2014.

# Appendix B: Summary of the Fund's benefits

Provided below is a brief summary of the non-discretionary benefits that we have taken into account for active members at this valuation. This shouldn't be taken as a comprehensive statement of the exact benefits to be paid. For further details please see the Regulations.

| Provision  | Benefit Structure To<br>31 March 2008  | Benefit Structure From 1<br>April 2008   | Benefit Structure From 1 April 2014   |

| 50/50 option            |   | n/a  | Optional arrangement allowing 50% of main benefits to be accrued on a 50% contribution rate.   |

Note: Certain categories of members of the Fund are entitled to benefits that differ from those summarised above.

#### **Discretionary benefits**

The LGPS Regulations give employers a number of discretionary powers. The effect on benefits or contributions as a result of the use of these provisions as currently contained within the Local Government Pension Scheme Regulations has been allowed for in this valuation to the extent that this is reflected in the membership data provided. No allowance has been made for the future use of discretionary powers that will be contained within the scheme from 1 April 2014.

# Appendix C: About the valuation

For more details please refer the Fund's Funding Strategy Statement.

It is important to realise that the actual cost of the pension fund (i.e. how much money it will ultimately have to pay out to its members in the form of benefits) is currently unknown. This cost will not be known with certainty until the last benefit is paid to the last pensioner. The core purpose of this valuation is to estimate what this cost will be, so that the Fund can then develop a strategy to meet it.

Such a valuation can only ever be an estimate – as the future cannot be predicted with certainty. However, as actuaries, we can use our understanding of the Fund and the factors that affect it to determine an anticipated cost which is as sensible and realistic as possible. A decision can then be made as to how much is set aside now to meet this anticipated cost. The pace of this funding can vary according to the level of prudence that is built into the valuation method and assumptions.

For this valuation, as for the previous valuation, our calculations identify separately the expected cost of members' benefits in respect of scheme membership completed before the valuation date ("past service") and that which is expected to be completed after the valuation date ("future service").

#### Past service

The principal measurement here is the comparison at the valuation date of the assets (taken at market value) and the value placed on the Fund's liabilities (calculated using a market-based approach). By maintaining a link to the market in both cases, this helps ensure that the assets and liabilities are valued in a consistent manner. Our calculation of the Fund's liabilities also explicitly allows for expected future pay and pension increases.

The funding level is the ratio of assets to liabilities at the valuation date. A funding level of less/more than 100% implies that there is a deficit/surplus in the Fund at the valuation date.

The funding target is to eliminate any deficit (or surplus) over a specified period and therefore get back to a funding level of 100%. To do so, additional contributions may be required to be paid into the Fund, either via lump sums or by increasing the employer's contribution rate. These additional contributions are known as the past service adjustment.

#### **Future service**

In addition to benefits that have already been earned by members prior to the valuation date, employee members will continue to earn new benefits in the future. The cost of these new benefits must be met by both employers and employees. The employers' share of this cost is known as the future service contribution rate.

For these valuation results for the Fund as a whole, we have calculated the future service rate as the cost of benefits being earned by members over the year following the valuation, taking account of expected future salary increases until retirement. If new entrants are admitted to the Fund to the extent that the overall membership profile remains broadly unchanged (and if the actuarial assumptions are unchanged) then the future service rate should be reasonably stable.

This funding method we have used is known as the Projected Unit Method. As well as the whole fund, it is appropriate for individual employers that continue to admit new entrants to the Fund.

However, some participating employers may have a policy of not admitting new entrants. In this case, the membership profile will inevitably begin to age. Under these circumstances, the Projected Unit Method is arguably no longer appropriate and will not promote sufficient stability in the future service rate. For these employers, we will adopt a funding method known as the Attained Age Method, which effectively looks at the cost of benefits that members will earn over the entirety of their remaining working lifetime (rather than just the year following the valuation).

Combining this future service rate with any past service adjustment required to repay a deficit (or reduce a surplus) gives us the total contribution rate. The total rate for the Fund as a whole is known as the common contribution rate. This is really just a notional figure. In practice, each individual employer will have a contribution rate which reflects their own particular circumstances.

#### The sensitivity of valuation results

The aim of this valuation is not only to determine these important figures but also to demonstrate their sensitivity to a number of key influences. This will promote an understanding of how the expected cost of the Fund may change in response to uncertain future events (e.g. changes in life expectancy or investment returns). Please refer to **section 5** for details of the sensitivity analysis.

# Appendix D: Data

This section contains a summary of the membership, investment and accounting data provided by the Administering Authority for the purposes of this valuation (the corresponding membership and investment data from the previous valuation is also shown for reference). For further details of the data, and the checks and amendments performed in the course of this valuation, please refer to our separate report.

|                           | Number Deferred pension |          | Number        | Deferred pension |  |
|                           |                         | (£000)   |               | (£000)           |  |
| Total deferred membership | 4,400                   | 3,522    | 5,213         | 4,708            |  |

The figures above also include any "status 2" (undecided leaver) and "status 9" (frozen refund) members at the valuation date.

#### Current pensioners, spouses and children

|                         | 31 March 2010 |                   | 31 Ma  | rch 2013          |
|-------------------------|---------------|-------------------|--------|-------------------|
|                         | Number        | Pension<br>(£000) | Number | Pension<br>(£000) |
| Members                 | 2,584         | 11,294            | 3,159  | 13,867            |
| Dependants              | 413           | 991               | 445    | 1,205             |
| Children                | 32            | 33                | 42     | 40                |
| Total pensioner members | 3,029         | 12,317            | 3,646  | 15,113            |

Note that the membership numbers in the table above refer to the number of records provided to us and so will include an element of double-counting in respect of any members who are in receipt (or potentially in receipt of) more than one benefit.

| Membership Profile  | Average Age (years) |      | FWL ( | years) |
|---------------------|---------------------|------|-------|--------|
|                     | 2010                | 2013 | 2010  | 2013   |
| Employees           | 50.8                | 50.4 | 7.7   | 9.3    |
| Deferred Pensioners | 49.8                | 50.3 | -     | -      |
| Pensioners          | 65.9                | 66.7 | -     | -      |

The average ages are weighted by liability.

The expected future working lifetime (FWL) indicates the anticipated length of time that the average employee member will remain as a contributor to the Fund. Note that it allows for the possibility of members leaving, retiring early or dying before retirement.

Note that the figures above are based on the Fund accounts provided to us for the purposes of this valuation, which were fully audited at the time of our valuation calculations.

# Appendix E: Assumptions

#### **Financial assumptions**

| Financial assumptions           | 31 March 2010<br>(% p.a.) | 31 March 2013<br>(% p.a.) |
|---------------------------------|---------------------------|---------------------------|
| Discount rate                   | 6.1%                      | 4.6%                      |
| Price inflation                 | 3.8%                      | 3.3%                      |
| Pay increases*                  | 5.3%                      | 4.3%                      |
| Pension increases:              | 3.3%                      | 2.5%                      |
| pension in excess of GMP        | 3.3%                      | 2.5%                      |
| post-88 GMP                     | 2.8%                      | 2.5%                      |
| pre-88 GMP                      | 0.0%                      | 0.0%                      |
| Revaluation of deferred pension | 3.3%                      | 2.5%                      |
| Expenses                        | 0.6%                      | 0.7%                      |

<sup>\*</sup>An allowance is also made for promotional pay increases (see table below). Note that the assumption as at 31 March 2010 is actually 1% p.a. for 2010/11 and 2011/12, reverting to long term assumption shown thereafter.

#### **Mortality assumptions**

| Longevity assumptions                      | 31 March 2013   |
|--|---|
| Longevity - baseline                       | Vita curves   |
| Longevity - improvements                   |   |
| CMI Model version used                     | CMI_2010  |
| Starting rates                             | CMI calibration based on data from Club Vita  |
|  | using the latest available data as at December  |
|  | 2011.   |
| Long term rate of improvement              | Period effects:   |
|  | 1.25% p.a. for men and women.   |
|  | Cohort effects:   |
|  | 0% p.a. for men and for women.  |
| Period of convergence                      | Period effects:   |
|  | CMI model core values i.e. 10 years for ages 50 and below and 5 years for those aged 95 and above, with linear transition to 20 years for those aged between 60 and 80. |
|  | Cohort effects:   |
|  | CMI core i.e. 40 years for those born in 1947 or later declining linearly to 5 years for those born in 1912 or earlier.   |
| Proportion of convergence remaining at mid | 50%   |
| point                                      |   |

We have suggested a longevity improvement assumption based on the latest industry standard and combined information from our longevity experts in Club Vita. The start point for the improvements has been based on observed death rates in the Club Vita data bank over the period.

In the short term we have assumed that the 'cohort effect' of strong improvements in life expectancy currently being observed amongst a generation born around the early and mid -1930s will start to tail off, resulting in life expectancy increasing less rapidly than has been seen over the last decade or two. This is known as 'peaked'.

In the long term (post age 70) we have assumed that increases in life expectancy will stabilise at a rate of increase of 1 year per decade for men and women. This is equivalent to assuming that longer term mortality rates will fall at a rate of 1.25% p.a. for men and women.

Various scaling factors have been applied to the mortality tables to reflect the predicted longevity for each class of member and their dependants. Full details of these are available on request.

#### Other demographic valuation assumptions

Retirements in ill health Allowance has been made for ill-health retirements before

Normal Pension Age (see tables below).

Withdrawals Allowance has been made for withdrawals from service (see

tables below).

Family details A varying proportion of members are assumed to be married (or

have an adult dependant) at retirement or on earlier death. For example, at age 60 this is assumed to be 90% for males and 85% for females. Husbands are assumed to be 3 years older

than wives.

Commutation 50% of future retirements elect to exchange pension for

additional tax free cash up to HMRC limits (equivalent 75% in

the new post-April 2008 scheme)

The tables below show details of the assumptions actually used for specimen ages. The promotional pay scale is an annual average for all employees at each age. It is in addition to the allowance for general pay inflation described above. For membership movements, the percentages represent the probability that an individual at each age leaves service within the following twelve months.

## **Death in Service table:**

# Appendix F: Events since valuation date

#### **Post-valuation events**

These valuation results are in effect a snapshot of the Fund as at 31 March 2013. Since that date, various events have had an effect on the financial position of the Fund. Whilst we have not explicitly altered the valuation results to allow for these events, a short discussion of these "post-valuation events" can still be beneficial in understanding the variability of pension funding.

#### **Investment conditions since 31 March 2013**

In the period from the valuation date to the end of February 2014, investment markets moved in the following manner:

- asset returns have been around 11%
- long term Government bond yields have risen by more than long term expected price inflation, which is likely to have reduced past service liabilities by approximately 6%

It should be noted that the above is for information only: the figures in this report have all been prepared using membership data, audited asset information and market-based assumptions all as at 31 March 2013. In particular, we do not propose amending any of the contribution rates listed in the Rates & Adjustments Certificate on the basis of these market changes, and all employer contribution rates are based on valuation date market conditions. In addition, these rates are finalised within a risk-measured framework as laid out in the Fund's Funding Strategy Statement (FSS).

We do not propose altering the FSS to include allowance for post-valuation date market changes, since this principle would then need to be adopted for future valuations even if markets had worsened since the valuation date (thus increasing contribution rates). Such a change in principle would then obstruct advance planning by employers. Only allowing for market changes where these reduced contribution rates, and not where they increased the rates, would not be consistent with prudent financial management of the Fund.

#### Other events

Other than investment conditions changes above, I am not aware of any material changes or events occurring since the valuation date.

# Appendix G: Rates and Adjustments Certificate

In accordance with regulation 36(1) of the Administration Regulations we have made an assessment of the contributions that should be paid into the Fund by participating employers for the period 1 April 2014 to 31 March 2017 in order to maintain the solvency of the Fund.

The method and assumptions used to calculate the contributions set out in the Rates and Adjustments certificate are detailed in the Funding Strategy Statement and our report on the actuarial valuation dated 26 March 2014.

The required minimum contribution rates are set out in the table below,

# Statement to the Rates and Adjustments Certificate

The Common Rate of Contribution payable by each employing authority under regulation 36(4)(a) of the Administration Regulations for the period 1 April 2014 to 31 March 2017 is 31.4% of pensionable pay (as defined in Appendix B).

Individual Adjustments are required under regulation 36(4)(b) of the Administration Regulations for the period 1 April 2014 to 31 March 2017 resulting in Minimum Total Contribution Rates expressed as a percentage of pensionable pay plus annual additional lump sum payment are as set out below.

The contributions shown include expenses and the expected cost of lump sum death benefits but exclude early retirement strain and augmentation costs which are payable by Fund employers in addition.
